

EDU-GUIDE:

A system you can trust.

Identified problems:

Students are suffering from a lack of motivation and concentration during online classes/lectures. Students need a site that spans from assisting them with notes to assisting with ensuring projects and other work move smoothly.

- Lack of engagement during distance learning.
- Issues regarding reviewing long grey(boring) recordings after class.
- Lack of accountability when submitting group projects on school sites, e.g., Blackboard.

Unique factors of EDU-GUIDE:

- Listens to online classes in real-time while taking notes.
Pdf/word
- Marks critical information time stamps when the user requests time stamps.
- Translation feature to accommodate the many languages spoken in South Africa.
- Summarisation of notes without using jargon

Accessibility/Gaps:

Any browser for free, opposed to our competitors, who charge monthly fees.

Lack of interactivity during Virtual classes.

Most sites are made in English, thus not accommodating learners who may find it difficult reading/speaking English/don't have English as a home language.

- Text/Hover to speech features

Features:

Group online meetings with fellow students.(Ability to link with the calendar too)

Real-life time class listening tool.

Time stamp features for virtual meetings/classes.

A Text-to-Speech translation portion

An AI summariser model that'll create the notes

A combination of AI, productivity tools, and accessibility.

Performance dashboard

Live language translator.

Study session planner, Calander and a clock.

Sirs added notes :

!!Replace AI model with API'S!!

Mobile first approach

Translates videos into notes

API

The second idea turns into a tab group

Exclude AI to detect work.

Project 2 merge:

Smart Academic Group Contribution Management System

Presentation Overview

1. Core Idea of the Project

This system is not just a task tracker.

It is designed to improve fairness and accountability in university group projects.

The goal is to reduce conflict between group members.

It provides measurable evidence of individual contribution.

Unlike tools like Trello or Google Docs, this system is built specifically for academic grading environments.

2. What Makes This System Different?

Unique Features:

Contribution Weighting System

Tasks do not all count the same.

Each task can include:

Difficulty level (Easy / Medium / Hard)

Estimated number of hours.

Importance level (Low / Medium / High).

Writing two pages is not equal to designing the full system.

Contribution is calculated based on weighted value, not just number of tasks.

This makes the system more accurate than simple task trackers.

Peer Verification Feature

When a member marks a task as complete, it must be confirmed by other group members.

Members can rate the contribution on a 1–5 scale.

They can also leave short feedback comments.

This prevents false reporting and increases transparency.

Most general productivity tools do not include peer validation.

Lecturer Summary Dashboard

The lecturer can view total tasks completed by each member.

The system shows weighted contribution percentages.

Peer ratings are displayed for transparency.

Late task history can be reviewed.

A group activity timeline is available.

This transforms the system into an academic assessment support tool, not just a productivity app.

Conflict Alert System

If a student contributes less than 15%, the system flags a warning.

If tasks are repeatedly overdue, the system detects it.

If peer ratings are consistently low, it raises attention.

A 'Low Participation Warning' notification is generated.

This helps identify free-riding early.

Reflection & Accountability Log

At the end of the project, each member submits a short reflection.

They explain what they contributed.

They describe challenges they experienced.

This creates documented evidence for grading fairness.

It reinforces accountability and academic integrity.
